Directions for using AutoHarm!

You should already have Ableton Live 10 and cloned or downloaded AutoHarm. Do not move anything out of the downloaded folder. AutoHarm only works on MIDI tracks.

Open Ableton Live and find the folder in your file path. You may need to “Add folder”, seen in the bottom left of the screenshot on the following page. Double click on “AutoHarm.amxd” to add AutoHarm to your track. You only need one instance of AutoHarm in your entire project. I suggest keeping it on your melody track for easy finding.

Pick two MIDI instruments from the instruments menu on the left.

Double click in the first clip slot where you want to write the melody. Enter your melody, for example by using a MIDI keyboard or clicking and adding notes.

Set the melody and harmony tracks you want to use and the number of output clips you want. Set the maximum chord probability slider. Hit go and the harmony clips will be created. If you selected more than one clip, they will appear in the clips directly below the clip set by the user.
